

A slide-deck skill.

This deck was built by the skill, along its own project-introduction path.

The problem

Decks are designed before anyone has settled what they argue.

A deck rebuilt after that costs a second drafting pass and a meeting.

The design is chosen first, so it cannot help.

01

A template opened before the argument exists.

02

Two or three loose points per slide.

03

The audience stops following by the middle.

04

AI drafts decks the same way, faster.

Before and after

The order is reversed: the argument is fixed first.

01

Then

Theme, type, hope the content fits

02

Now

Content, spine, grid, render

03

For

A pitch, a review, a talk

04

Result

Headlines that argue on their own

What we are aiming at

Headlines that state the argument.

01

One idea per slide.

02

Titles are full sentences,
not labels.

03

Every claim carries its
source.

04

The grid comes from the
maths.

05

The last slide is the ask.

The skill covers four stages, and no more.

01

Stage 1

Content, cleaned and sourced

02

Stage 2

Spine: one idea a slide

03

Stage 3

Design system from the grid

04

Stage 4

Render to Marp, PDF, PPTX

Why us, why this

The layout is not opened until the spine is approved.

Method: Josef Müller-Brockmann, Grid Systems in Graphic Design (Niggli).

The skill produced this deck, stage by stage.

01

Built by

grid.py, from tokens.json

02

Type area

1165 × 567, 27 baselines

03

Maintainer

Sinaida Krivchenko, Prague

04

Repo

sinaida-space on GitHub

What it takes

Most of what it needs already exists.

01

Have: the skill, grid.py, the typography skill, the method.

02

Need: outside testing, a Typst path, example decks.

03

Risk, renderer drift: one source, tokens.json.

04

Risk, scope creep: the Never list holds it.

It is free. The value is a deck built once, not rebuilt.

For anyone who makes decks and wants them to read as one object.

Install it and run it on your next real deck.
